Sample: The LITS-4 household survey was jointly conducted by the World Bank and EBRD in 2022. Following a multi-stage clustered stratification sampling procedure by geographical region and level of urbanity, it established the PSUs in each country and selected households within each PSU with equal probability. The survey interviewed between 1,000-1,500 households across 33 countries and collects information about public attitudes, well-being and the impact of economic and political changes on the household. The sample considered is restricted to adult individuals aged 18 years and above with information about consumption, sex, ethnicity, religion, place of birth, language, father's education, mother's occupation, father's occupation and mother's education. Section 3 of this document describes the prevalence and pattern of missing data. When sample size was not enough to ensure the reliability of our estimates, we pooled data from LITS-3, the previous wave.. There are 2,033 individuals in the total sample and 1,902 individuals in the analysis sample. Section 3 of this document describes the prevalence and pattern of missing data.

Weights: The weights in the sample reflects the gender and age breakdown within the country's population. (weight)

Outcome: The outcome variable is annualised household income per capita in USD PPP 2017¹

Circumstances:

- Ethnicity (various ethnic groups and others described in Table 1)
- Sex (female, male)
- Region of upbringing (categories described in Table 1)
- Fathers's edu. (education levels, described in Table 2)
- Mother's edu. (education levels, described in Table 2)
- Father's occ. (1-digit ISCO categories, described in Table 3)
- Mother's occ. (1-digit ISCO categories, described in Table 3)

¹Income variable was equivalized using the square root scale.
